

**Topic:** Laws of logarithms

**Question:** Write the expression as a rational number if possible, or if not, as a single logarithm.

$$\log_3 54 - \log_3 2$$

**Answer choices:**

A  $-\log_3 9$

B  $9$

C  $\log_3 27$

D  $3$

**Solution: D**

First, use the rule

$$\log_a x - \log_a y = \log_a \frac{x}{y}$$

to rewrite the given expression.

$$\log_3 54 - \log_3 2$$

$$\log_3 \frac{54}{2}$$

$$\log_3 27$$

To simplify further, use this rule:

$$\text{If } \log_a y = x, \text{ then } a^x = y.$$

If we let  $x = \log_3 27$ , then  $3^x = 27$ . Therefore,  $x = 3$ , because  $27 = 3 \cdot 3 \cdot 3 = 3^3$ .

**Topic:** Laws of logarithms**Question:** Which expression is equal to 1?**Answer choices:**

- A  $\log_5 20 - \log_5 10$
- B  $\log_3 18 - \log_3 6$
- C  $\log_2 8 - \log_2 7$
- D  $\log_8 128 - \log_8 2$

**Solution: B**

Use these two rules to evaluate each expression.

$$\log_a x - \log_a y = \log_a \frac{x}{y}$$

$$\text{If } \log_a y = x, \text{ then } a^x = y.$$

Applying the first rule to the answer choices gives

$$\text{A} \quad \log_5 20 - \log_5 10 = \log_5 \frac{20}{10} = \log_5 2$$

$$\text{B} \quad \log_3 18 - \log_3 6 = \log_3 \frac{18}{6} = \log_3 3 = 1$$

$$\text{C} \quad \log_2 8 - \log_2 7 = \log_2 \frac{8}{7}$$

$$\text{D} \quad \log_8 128 - \log_8 2 = \log_8 \frac{128}{2} = \log_8 64 = 2$$

Now we'll show that the values of the expressions we found for answer choices A and C are not equal to 1.

For answer choice A, let  $x = \log_5 2$ . By the second rule given above,  $5^x = 2$ . We know that  $5^1 = 5$ , so  $5^x \neq 5^1$ . Since  $5^x \neq 5^1$ , this tells us that  $x \neq 1$ . So  $\log_5 2 \neq 1$ .

For answer choice C, we can use similar reasoning. Let  $x = \log_2(8/7)$ . By the second rule given above,  $2^x = 8/7$ . We know that  $2^1 = 2$ , so  $2^x \neq 2^1$ . Therefore,  $x \neq 1$ , and  $\log_2(8/7) \neq 1$ .

**Topic:** Laws of logarithms

**Question:** Write the expression as a rational number if possible, or if not, as a single logarithm.

$$\log_2 \frac{1}{4} + \log_2 16$$

**Answer choices:**

- A      2
- B      4
- C       $\log_2 8$
- D       $\log_2 64$

**Solution: A**

Use these two rules to evaluate the expression.

$$\log_a x + \log_a y = \log_a xy$$

$$\text{If } \log_a y = x, \text{ then } a^x = y.$$

Applying the first rule to the given expression gives

$$\log_2 \frac{1}{4} + \log_2 16$$

$$\log_2 \left( \frac{1}{4} \cdot 16 \right)$$

$$\log_2 4$$

It's probably obvious from this that  $\log_2 4 = 2$ , but if not, use the second rule above. If we let  $x = \log_2 4$ , then

$$2^x = 4$$

$$x = 2$$
